G-FOR S0701 Comment Filler — User Guide

Turns the Word comments in a reviewed document into a filled G-FOR S0701 verification report, without Claude. One HTML file that runs offline in Microsoft Edge. No installation and no admin rights needed, and your files never leave your PC.

One-time setup

1. Save `G-FOR_Comment_Filler.html` somewhere permanent, e.g. OneDrive › Tools.
2. Double-click it. If it opens in another browser, right-click › *Open with* › *Microsoft Edge*.
3. Optional: pin it to Edge favourites. The G-FOR S0701 rev.01 template is built in, so you don't need a separate template file.

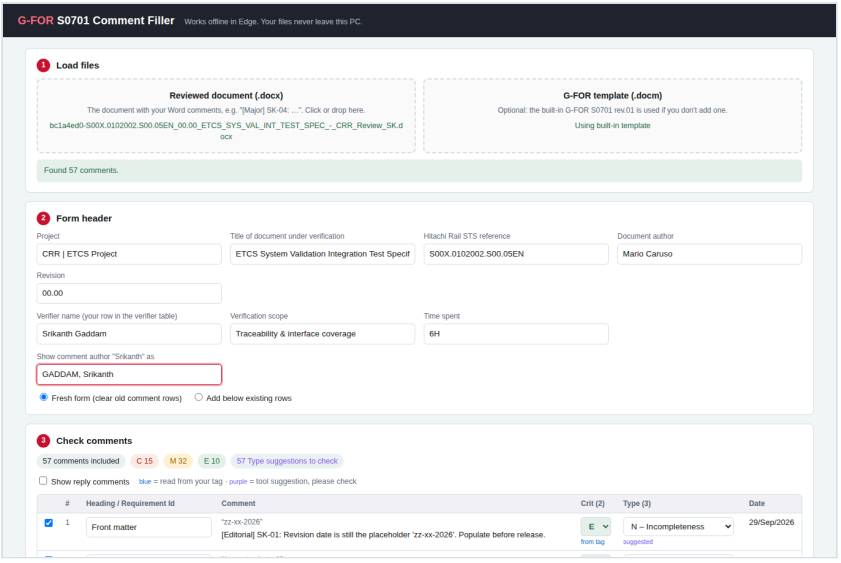

While reviewing: tag your Word comments

Start the comment with	Result in the G-FOR
`[Major]` or `[Critical]`	Criticality **C**
`[Minor]`	Criticality **M**
`[Editorial]`	Criticality **E**
`[C-T]`, `[M-I]`, … (criticality-type)	Sets **both** columns. No suggestion is needed.

Untagged comments get a suggested value that you confirm in step 3. Select the text you are commenting on: it appears as "Commented Text" in the form.

Filling the form: 4 steps

1. **Load files.** Drop in the reviewed `.docx`. A large spec (about 900 pages) takes 5–60 s. To use a different template revision, add your own `.docm`.
2. **Form header.** Title, reference, author and revision are read from the document; correct them if needed. Enter your verifier name, scope and time spent. Set how your name appears (e.g. *GADDAM, Srikanth*). The tool remembers this on your PC. Choose *Fresh form* (clears old rows) or *Add below existing rows*.
3. **Check comments.** Each row shows the heading (§ number + procedure ID, or Appendix + table), the commented text and your comment. Blue = taken from your tag. Purple = suggestion, so check it. Untick a row to leave it out. Click a comment to expand it. Reply comments are hidden unless you tick *Show reply comments*.
4. **Download.** Click *Download filled G-FOR (.docm)*. The file goes to your Downloads folder, named `G-FOR_S0701_01_EN_<reference>_<rev>.docm`.

What the tool fills, and what it leaves for you

Filled automatically	Left for you or the author

- Comment rows: No. (auto-numbered), author, heading, commented text and comment, Criticality (2), Type (3), comment date
- Header: project, title, Hitachi Rail STS reference, author, revision
- Your row in the verifier table: name, V1 = X, scope, time spent
- Comment Criticality and Type summary counts

- TC project code, required date of comments return, TC original creation date
- Page/line numbers (the heading column gives § and procedure ID only)
- Action/answer (4) and feedback dates (5)–(7): the author's and Main Verifier's fields
- The form's macros are kept unchanged. On Windows you can still use its Refresh button.

Before you issue it

- Check every purple Type. On the CRR test spec review, the suggestions matched my manual calls on 46 of 57 comments. The rest were judgement calls between Traceability, Technical error and Incompleteness.
- Open the .docm in Word, fill in the header placeholders and save.
- Headings use the document's own numbering, cross-checked against its table of contents. If a heading is unnumbered or numbered by hand, the § may need a manual fix. You can edit it in step 3.

Troubleshooting

Message / symptom	Cause and fix
"No Word comments found"	The file has no comments, or you dropped the wrong file. Use the reviewed copy.
"This does not look like a G-FOR S0701 form"	The template you added has no comments table. Remove it to use the built-in template.
Nothing downloads	Check Edge's Downloads panel (Ctrl+J). Edge may ask you to *Keep* a macro-enabled file.
Heading shows "Front matter"	The comment is before section 1 (cover, revision or contributors table). Rename it, e.g. "Cover / Revision table".
Word warns about macros on opening	This is normal for any .docm. The macros are the original G-FOR ones.

What has been tested: the tool was run end to end in Chromium (the engine Edge uses) on the CRR ETCS SYS VAL INT TEST SPEC review (57 comments, 880 pages). The output matched the G-FOR prepared manually on 1 Oct 2026: same rows, the same text in 56 of 57 comment cells (the 57th differs only by trailing whitespace) and the same criticality counts (C 15 · M 32 · E 10). The output was checked visually after converting to PDF. **Not yet tested:** Edge on your work laptop and opening the output in desktop Word. Run it once on a known review first.
